PROFILE

SC-cleared Cyber Security graduate (2:1) looking for a Tier 1 SOC analyst role. I run a home SOC on Wazuh and Sysmon where I have executed, triaged and documented nine attack scenarios against MITRE ATT&CK, and I co-founded a UK IT support business where I work a live Jira Service Management queue, resolving and writing up real customer tickets. My final year project was a Cowrie honeypot I attacked myself with IoT default-credential wordlists: 552 logged attempts, and 16 of the 30 credential values I used turned out to be hard-coded in the original Mirai source. Working toward CompTIA Security+ (SY0-701) and active on Hack The Box.

SECURITY CLEARANCE

SC (Security Check) and BPSS — held. Both obtained to work on a clearance-gated logistics contract at GXO Logistics. Willing to undergo further vetting.

TECHNICAL SKILLS

Security operations: SIEM monitoring and log analysis (Wazuh), alert triage, detection rule authoring, MITRE ATT&CK mapping, incident reporting, response playbooks, phishing and malware hash triage

Endpoint & log sources: Sysmon, Windows Event Logs (4625, 4720, 4698, 1102, 5007), PowerShell command-line logging, Linux auth logs, Cowrie JSON

Systems & directory: Windows Server, Active Directory, Group Policy, NTFS/share permissions, Ubuntu Server 22.04, Kali Linux

Business systems & data: Enterprise WMS (system-of-record data entry, reconciliation, exception handling), Jira Service Management, document control, SOP compliance, auditable record-keeping

Networking: TCP/IP, DNS, DHCP, firewalls, Wireshark, Nmap, iptables

Cloud & identity: Microsoft 365, Entra ID, Defender for Cloud, IAM fundamentals; Microsoft Sentinel and KQL (home lab, in progress)

Scripting & tooling: Python (pandas, matplotlib), Bash, PowerShell, Git/GitHub, Jira Service Management, VirtualBox, Hydra, Burp Suite

SECURITY PROJECTS

SOC Detection Lab | Security Operations & Detection • 2025 – 2026

github.com/HarryKlrr/soc-detection-lab

- Deployed Wazuh (SIEM/HIDS) with Sysmon telemetry on a Windows 10 endpoint in an isolated virtual network, correlating Windows Event Logs and process events in a single console.
- Executed nine attack scenarios from Kali Linux — brute force, base64-encoded PowerShell, admin account creation, Defender tampering, audit log clearing, scheduled-task persistence, Nmap reconnaissance, phishing triage and malware hash triage — mapping each to a MITRE ATT&CK technique.
- Triageed every resulting alert and produced nine formal incident reports and three response playbooks covering detection logic, scope, containment and remediation.
- **Authored and validated custom Wazuh rules and Sigma drafts**, and identified two genuine detection gaps in the process — a missing log-forwarding rule and a custom rule that silently never fired — both documented and fixed rather than omitted.

IoT Honeypot & Threat Analysis | Final Year Project • 2025 – 2026

github.com/HarryKlrr/iot-honeypot

- Built a medium-interaction Cowrie honeypot on Ubuntu Server 22.04 emulating a vulnerable IoT device over SSH and Telnet, inside an isolated VirtualBox host-only network with Kali Linux as the attack host (Hydra, Nmap, Nikto, Dirb).
- Captured and analysed 552 authentication attempts (98.4% failed) with a Python pipeline (pandas, matplotlib) profiling credential use, session behaviour and attack timing.
- **Established that 7 of 10 usernames and 9 of 20 passwords matched Mirai's hard-coded credential set** — including xc3511 (XiongMai cameras) and vizxv (Dahua DVRs) — confirming IoT-botnet targeting, and produced a threat-intelligence report mapped to MITRE ATT&CK with defensive recommendations.

Azure Cloud Security Lab | Cloud Detection - In Progress • 2026

github.com/HarryKlrr/azure-cloud-security-lab

- Moving the same detection work into a cloud tenant: Entra ID, Microsoft Sentinel as the SIEM and Defender for Cloud for posture. Tenant and Log Analytics workspace built, sign-in and audit logs ingesting.

- In progress - introducing misconfigurations deliberately (impossible-travel sign-ins, over-privileged accounts, public storage) and writing a KQL hunting query for each class before turning the useful ones into analytics rules.

Windows Server & Active Directory Build | University Module · 2024 – 2025

- Deployed a domain controller and single-domain AD environment (DNS, DHCP, AD DS, WDS, WSUS); created users, OUs and security groups, and hardened user environments with Group Policy, NTFS/share permissions and disk quotas.

WORK EXPERIENCE

Co-founder & IT Support Analyst | HJ Digital Solutions · 2026 – Present

- Co-founded a UK IT support business. Every request is raised, triaged, resolved and closed through Jira Service Management, with a written resolution recorded on every ticket — there is no untracked side channel.
- Work the live queue: diagnosis, resolution and documentation across Windows, Microsoft 365, networking, printers and device setup.
- **Handle security-adjacent requests** — phishing and suspicious-email triage, account compromise checks, and hardening advice for small-business Microsoft 365 tenants.
- Conduct remote support sessions with explicit customer consent, and refer anything outside our capability rather than attempting it.
- Built and maintain the company website: eight pages, WCAG 2.1 AA contrast verified, keyboard navigable, fully usable with JavaScript disabled, deployed on Cloudflare Pages.

Multi-Task Warehouse Operative | GXO Logistics, Kingswinford · Jun 2026 – Present

- **Cleared to SC for this contract** — working under the access-control, data-handling and site-security rules that apply on a cleared site.
- **Transactional data entry into an enterprise warehouse management system (WMS)** — the system of record for stock and consignment movement. Records I key in are consumed downstream by other users and reports, so data accuracy at the point of input is the core of the role.
- **Reconciliation and exception handling** — validating inbound consignments against their system records and dispatch documentation, identifying variances between physical and system state, and raising them as exceptions rather than allowing inaccurate data into the system.
- **Document control and SOP compliance** — processing goods-in and dispatch documentation to a defined procedure, in an environment where records are auditable after the fact.
- Work a queue to fixed daily throughput targets without trading accuracy for speed — the same trade-off a SOC queue demands under alert volume: resolve what you can, escalate what you cannot, and leave a record either way.

Quality Assurance Operator | The Cotswold Company, Lichfield · Jul 2025 – Sep 2025

- Inspected assembled furniture against documented quality standards before sign-off, rejecting and reworking units that failed.
- Disassembled and repackaged products for dispatch to prevent transit damage, and applied health, safety and manual handling procedures consistently across the shift.

Delivery Driver | Evri · Nov 2024 – Jan 2025

- Managed a daily delivery route independently to tight timescales, using handheld systems to scan, track and confirm every parcel.

Pick & Packer | Iceland · Jul 2023 – Sep 2023

- Picked and packed customer orders accurately at pace using in-store scanning systems, meeting daily targets as part of a busy team.

EDUCATION & CERTIFICATIONS

CompTIA Security+ (SY0-701) — in progress

BSc (Hons) Cyber Security, Cloud Computing & Marketing — 2:1 · Nottingham Trent University · Graduating 2026

A Levels: Computer Science (B), Psychology (C), Business (C)

GCSEs: 10 passes including Computer Science (7), Maths (6), English Language (5) and English Literature (5)

ADDITIONAL

- **Hack The Box** — active in own time, working through machines and challenges to sharpen enumeration and detection skills.
- **Army Reserve (Royal Signals)** — application accepted.
- Full UK driving licence and own transport. Amateur boxer, training five to six days a week. References available on request.
